

# Python Scripting Exercise

## Topics covered

Write a Python script based on the following requirements:

- 1-Display all the prime numbers between 1 to 250.
- 2-Store the results in a results.txt file.
- 3-Test the script. Verify that it produced the expected results in the results.txt file.
- 4-Save the script and make a note of its location (absolute path) for future reference.
